문▶ ★ 문▶

Al and Law: a combination that comes from afar

The Law

- is made of Rules
- interprets and creates Facts

イロト イボト イヨト イヨト

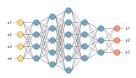

Al and Law: a combination that comes from afar

The Law

- is made of Rules
- interprets and creates Facts

- The Turing Machine processes Facts (data) through Rules
 - Symbolic paradigm
 - Rules expressed by symbols
 - Collection of rules and algorithms
 - ex: Expert Systems
 - Sub-symbolic paradigm (connectionist models)
 - Rules as combination of elementary processing structures
 - Learning by examples
 - ex: Neural Networks

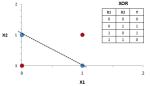

Limited results in the symbolic AI

- toy applications
- costs and complexity of representing and keeping information up-to-date
- not all the information can be represented in symbolic form

Limits of the computational power of the first connectionist models

• XOR problem (Marvin Minsky and Seymour Papert)

Al Winter: crisis in the Artificial Intelligence research

Elaine Rich (Univ. Texas), Kevin Knight (Univ. South. California)

Intelligence requires Knowledge

Al Winter due to the lack of Knowledge available

Problems in managing Knowledge

- it's voluminous
- it is hard to characterize accurately
- it is constantly changing
- it requires a semantic organization

・ 同 ト ・ ヨ ト ・ ヨ ト

Al and the Web: the end of the Al Winter

On mid '90s the AI meets the Web

- Availability of large quantity of information in digital format for the development of AI systems
- Internet and the Web need advanced applications for managing data

Al and the Web: the end of the Al Winter

On mid '90s the AI meets the Web

- Availability of large quantity of information in digital format for the development of AI systems
- Internet and the Web need advanced applications for managing data

< □ > < 同 > < 回 >

The evolution of the AI has followed the evolution of the Web

How the Web has evolved from Web 1.0 to Web 3.0?

Enrico Francesconi Semantic Web, Open Data and AI

Evolution of the Web

Web 1.0 Static Web

- Static information
- Limited interaction with users

Evolution of the Web

Web 2.0

Social Web

Web 1.0

- Sharing content
- Collaborative content creation

Search Engines in Web 1.0 and 2.0

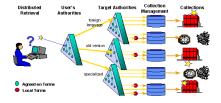

• Key concept: Users' Information Needs

a gap between what we know and what we want to know that motivates the search and this results in the formulation of a query

- Keywords indexing
- Query based on keywords and not on semantics
- Semantics is inferred:
 - by contexts
 - by algorithms able to infer the meaning of queries and contexts

・ 同 ト ・ ヨ ト ・ ヨ ト

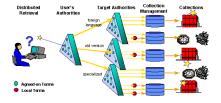

Unique point of access to resources in a distributed environment

イロト イボト イヨト イヨト

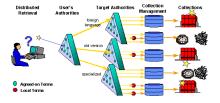

э

Unique point of access to resources in a distributed environment

(日)

Unique point of access to resources in a distributed environment

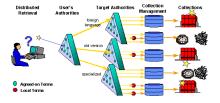

< □ > < 同 > < 回 >

Advanced information retrieval and reasoning services (ex. in the legal domain)

• Which version of law n. 123 issued on 15 March 2007 was in force on 1 December 2010?

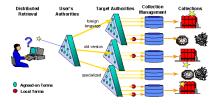

Unique point of access to resources in a distributed environment

< □ > < 同 > < 回 >

- Which version of law n. 123 issued on 15 March 2007 was in force on 1 December 2010?
- In which laws Mr. XY is the first signer?

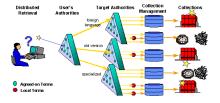

Unique point of access to resources in a distributed environment

・ロト ・同ト ・ヨト ・ヨト

- Which version of law n. 123 issued on 15 March 2007 was in force on 1 December 2010?
- In which laws Mr. XY is the first signer?
- Which laws on consumer protection do apply in a [specific region]?

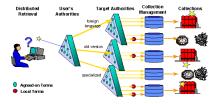

Unique point of access to resources in a distributed environment

Image: A matrix

Semantic Web to overcome semantic and language barriers

The top-down approach needs:

- Standardization activities in working groups
- Wide coordination and economic efforts of the involved actors to adopt the proposed standards and models

Benefits		Drawbacks
Relevance of		Results on data exposition
research achievements	\iff	not comparable to such
		achievements

向下 イヨト イヨト

Based on exactly the same technological stack and principles of the Semantic Web

Guidelines for implementing the Semantic Web to enable data sharing and reuse on a massive scale:

- Use URIs as names for things.
- Use HTTP URIs, so that people can look up those names.
- When someone looks up a URI, provide useful information, using the standards (RDF, SPARQL).
- Include links to other URIs, so that the user can discover more things.

Linked Data objectives

- Exposing data according to the Linked Data guidelines at the available level of interoperability
- Including links where possible
- Leaving the effort of semantic enrichment and interconnection to a virtuous trend stimulated by data consuming

Linked Open Data (LOD)

Linked Data released under an open licence, which does not impede their reuse for free. Creative Commons CC-BY-SA is an example open license

The Semantic Web (Web 3.0) is made up of Linked Open Data

- Semantic Web is the *whole*
- Linked Open Data is the parts

Today's economy revolves around data

European data market in the EU28 (2016)

Cit: "The Economic Benefits of Open Data" European Data Portal

https://www.europeandataportal.eu/en/highlights/economic-benefits-open=datap 🕨 🗧 🕨 📑 🔊 🖉 🖉

Open Data economy is supposed to generate

- an additional growth up to 4% of the GDP by 2020
- a growth in cumulative revenues in the period 2016-2020 estimated to 110 million Euro
